

AMENDMENT

In the Claims:

1. **(Previously Amended)** A computerized method for determining a
community rating for a particular user of a plurality of users within an
electronic community comprising:
maintaining a characteristic value for each of the plurality of users, each
characteristic value representing a rating for a given user;
maintaining a set of relationships between the plurality of users; and
deriving a community rating for the particular user by performing a function
on the characteristic values of the users of the plurality of users
related to the particular user.

2. **(Original)** The method of claim 1, wherein the electronic community is a
community for the buying and selling of merchandise over a network.

3. **(Original)** The method of claim 2 wherein the network comprises the
internet.

4. **(Original)** The method of claim 1, wherein the characteristic value is
based on feedback received from other users of the plurality of users in
the electronic community.

5. **(Original)** The method of claim 4, wherein the feedback is received from
other users who have bought or sold goods or services with the particular

3 user.

1 6. **(Original)** The method of claim 1, wherein the set of relationships includes
2 sponsorship relationships between the particular user and any users of the
3 plurality of users that were sponsored by the particular user.

1 7. **(Currently Amended)** The method of claim 6, wherein the relationships of
2 the plurality of users [can be] are represented as one or more n-ary trees.

1 8. **(Original)** The method of claim 6, wherein information concerning the
2 relationships between the plurality of users is stored in data structures for
3 each user of the plurality of users.

1 9. **(Original)** The method of claim 8, wherein the data structure for the
2 particular user contains a pointer to at least one user of the plurality of
3 users that was sponsored by the particular user.

1 10. **(Original)** The method of claim 1, wherein a recursive routine is used in
2 determining a community rating for the particular user.

1 11. **(Original)** The method of claim 10, wherein the community rating and the
2 characteristic values are numerical.

1 12. **(Original)** The method of claim 11, wherein the community rating is an
2 aggregate of the characteristic value for each user of the plurality of users
3 that is a lineal descendant of the particular user and the characteristic
4 value of the particular user.

1 13. **(Currently Amended)** A method comprising:

2 maintaining a reputation value on each user of a plurality of users within
3 an electronic trading community through which goods and services
4 are bought and sold, the reputation value being derived for a
5 particular user of the plurality of users from feedback received
6 concerning the particular user from other users of the plurality of
7 users;

8 maintaining a set of relationships between the plurality of users, the set of
9 relationships including sponsorship relationships between the
10 particular user and any users of the plurality of users that were
11 sponsored by the particular user, where the set of relationships for
12 a particular user [can be] is represented as an n-ary tree; and
13 deriving a community rating for the particular user by aggregating the
14 reputation value for each user of the plurality of users that is related
15 to the particular user through a linear sponsorship succession as
16 [can be] is represented by the n-ary tree in which the particular user
17 is the root of the n-ary tree.

14. **(Currently Amended)** A computer-readable medium having computer-
executable instructions for performing a method in a computer system for
determining a community rating for a particular user of a plurality of users
within an electronic community comprising:
5 maintaining a characteristic value for [a] each user of the plurality of users,
6 each characteristic value representing a rating for a given user;

maintaining a set of relationships between the plurality of users; and
deriving a community rating for the particular user by performing a function
on the characteristic values of the users of the plurality of users
related to the particular user.

15. **(Original)** The computer-readable medium of claim 14, wherein the
electronic community is a community for the buying and selling of
merchandise using an electronic forum.

16. **(Original)** The computer-readable medium of claim 15, wherein the
characteristic value is based on feedback received from other users of the
plurality of users in the electronic community.

17. **(Original)** The computer-readable medium of claim 16, wherein the set of
relationships includes sponsorship relationships.

18. **(Original)** The computer-readable medium of claim 17, wherein the
community rating and the characteristic values are numerical, and the
community rating is an aggregate of the characteristic value for each user
of the plurality of users that is a lineal descendant of the particular user
and the characteristic value of the particular user derived using a recursive
routine.

19. **(Original)** A computer system for determining a community rating for a
particular user of a plurality of users within an electronic community
comprising:

B1

4 a storage device having stored therein information and data relating to one
5 or more sets of relationships between a plurality of users of an
6 electronic community, one or more characteristic values for each
7 user of the plurality of users, and one or more routines for
8 determining one or more community ratings based on the
9 characteristic values of each user of the plurality of users and the
10 relationships between the plurality of users; and
11 a processor coupled to the storage device for executing the one or more
12 routines to derive the one or more community ratings.

1 20. **(Original)** The computer system of claim 19 further comprising a network
2 interface connected with a communications network over which data and
3 information related to and including the one or more characteristic values
4 and one or more community values for each user of the plurality may be
5 transmitted.

1 21. **(Previously Added)** The method of claim 1, wherein the rating comprises
2 a reputation value.

add D2
